AS-IS Process Map

The current specimen identification and tracking workflow, with pain points and baseline metrics.

PROJECT

Northlake Community Hospital – Specimen Identification & Tracking Improvement

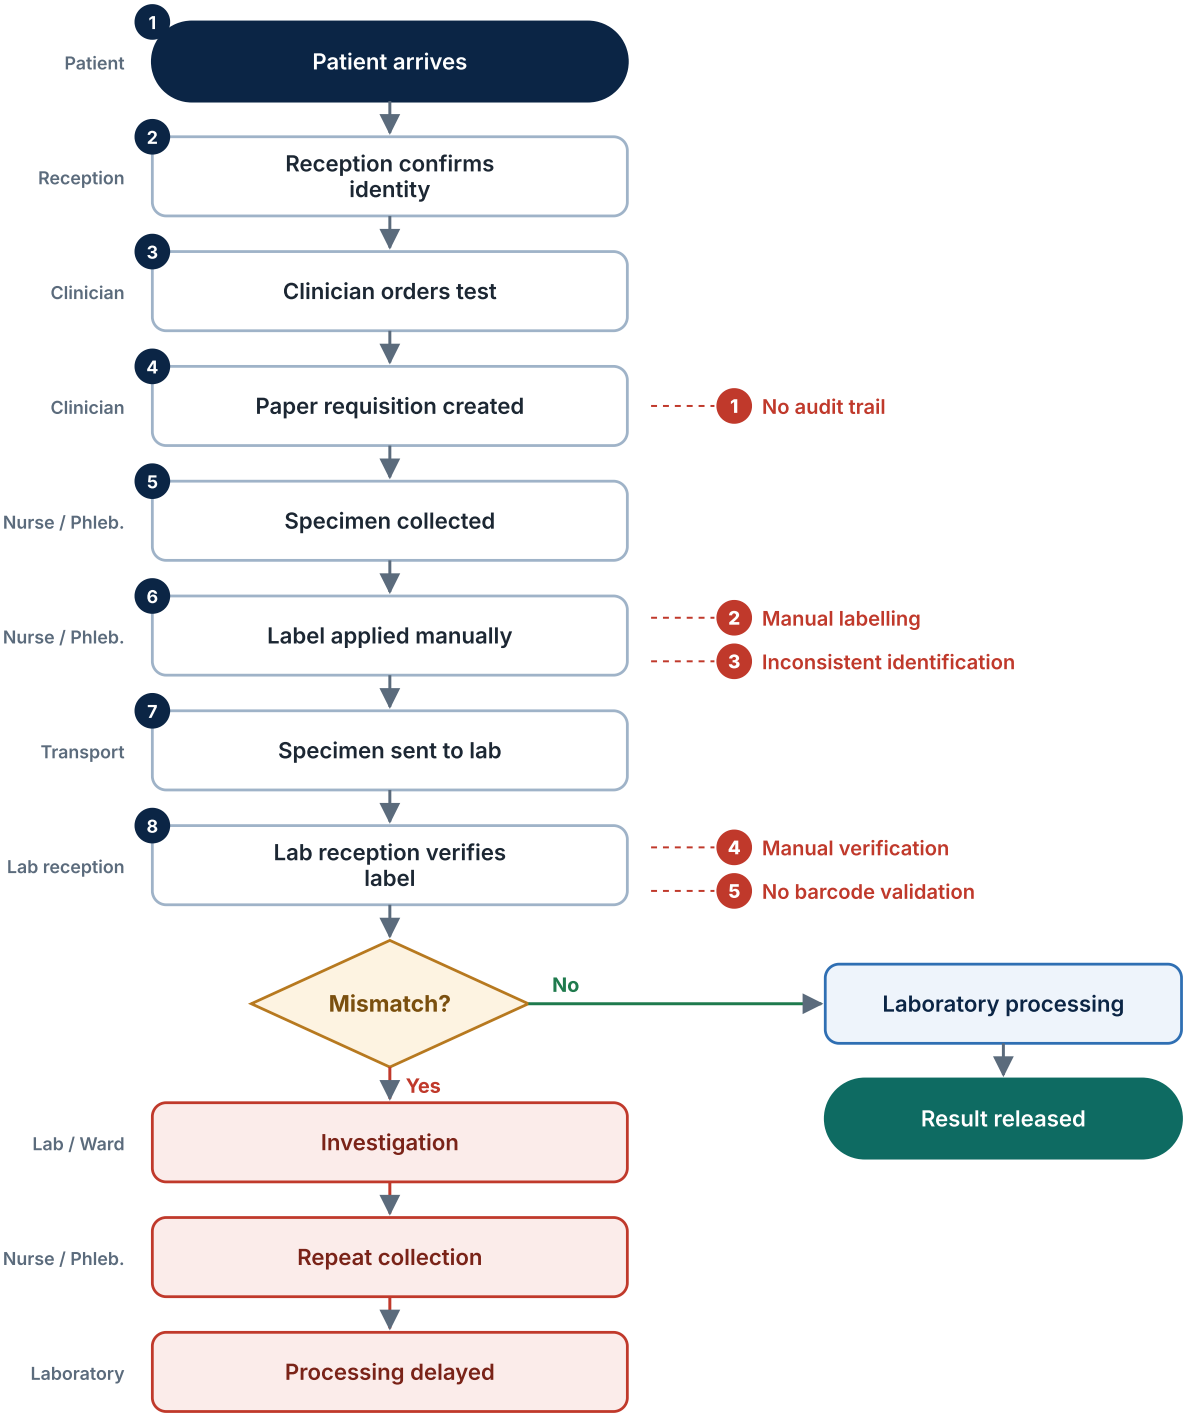

DOCUMENT REF	VERSION	DATE
NCH-BA-03	1.0	October 2026
PREPARED BY	**ROLE**	**PURPOSE**
Michael Solomon	Business Analyst	Current-state analysis

ⓘ Portfolio case study completed on the 10Alytics Healthcare Business Analysis Program. Northlake Community Hospital is a case-study organisation; all figures are case-study data.

CURRENT-STATE PROCESS

AS-IS Process Map

How a specimen moves from patient arrival to the laboratory today. Red steps show the failure path when a label mismatch is found.

ANALYSIS

Key issues identified

Manual labelling
Labels are applied by hand at collection.

Manual verification
Lab reception checks every label by eye.

No barcode validation
Nothing checks the specimen against the patient.

No audit trail
Paper requisitions leave no digital record.

Inconsistent specimen identification
Identification varies between staff and wards.

Repeat collections
Mismatches force the patient to be re-sampled.

Delayed results
Investigation holds up laboratory processing.

Baseline metrics

52	23	11	18
Specimen exceptions	Delayed results	Repeat collections per month	Patient complaints

Baseline figures from the Northlake case-study data.

Root of the problem. Identification relies on manual labelling and visual checks with no barcode validation or audit trail, so mismatches are only caught at laboratory reception — triggering investigation, repeat collections and delayed results.
